

PLAINFIELD RE-ENTRY EDUCATIONAL FACILITY 2021 CONSUMER CONFIDENCE REPORT

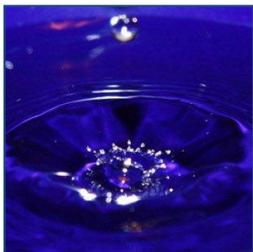

Why Am I Receiving This Report? In order to ensure that tap water is safe to drink, the Indiana Department of Environmental Management (IDEM) and the Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. Federal Drug Administration (FDA) regulations establish limits for contaminants in bottled water that must provide the same protection for public health Per 327 IAC 8-2.1 of the Indiana Administrative Code, the Plainfield Water Works is required to provide an annual Consumer Confidence Report which informs you, the customer, about the quality of your drinking water.

During 2021, the Plainfield Re-Entry Educational Facility system received violations for "Monitoring, Routine (DBP), Major" for failing to test our drinking water in accordance with the requirements for sampling between July and September for Haloacetic Acids (HAA5) and Total Trihalomethanes (TTHM). Because of these failures, we cannot be sure of the quality of our drinking water for HHA5 and TTHM during 2021.

Who We Are - The Plainfield Re-Entry Educational Facility (Public Water Supply Identification Number (PWSID) 5232007) provides water service to approximately 2,000 individuals from one water treatment plant and 2 ground water wells which are operated by the Town of Plainfield. The Plainfield Water Works system is capable of producing approximately 9.5 million gallons of treated drinking water each day. The drinking water treatment begins with aerating and chlorinating the well water, which oxidizes the naturally occurring iron and manganese contained in the ground water. Oxidized iron and manganese is then removed by pressure filtration, and the filtered water is chlorinated in order to maintain a residual level of disinfectant throughout the distribution system.

What Are Some of The Sources Of Drinking Water? - The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals, and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include the following:

- Microbial contaminants, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, can be naturally-occurring or result from urban stormwater run-off, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides may come from a variety of sources, such as agriculture, urban stormwater run-off, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater run-off, and septic systems.
- Radioactive contaminants can be naturally-occurring or be the result of oil and gas production and mining activities.

What About Lead In Our Drinking Water? If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The public water supply is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at (800) 426-4791 or at <http://www.epa.gov/safewater/lead>.

What About Bottled Water? Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at (800) 426-4791.

How Can I Learn More? – You can contact the Town of Plainfield's Utility Manager by calling 839-3490 during regular business hours. Also, the Town of Plainfield Council Meetings are typically held on the second and fourth Mondays of each month beginning at 7:00pm. Council meetings are held at the Plainfield Fire Territory Headquarters at 591 Moon Road, Plainfield.

2021 Water Quality Test Results

The State allows monitoring for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of the data, though representative, is more than one year old. Unless otherwise noted, all data are results from samples collected in the year 2021. Only those contaminants which were detected are listed below:

Water Quality Characteristic And Data Year	Unit of Detection	Highest Detected Level	Range of Detected Levels	MCL *	MCLG **	Potential Sources of Contamination
SYNTHETIC ORGANIC COMPOUNDS – NONE DETECTED						
INORGANIC CHEMICALS						
Nitrate	ppm	1.11	1.11	10	10	Runoff from fertilizer use; Erosion of natural deposits
Arsenic	ppb	1.9	1.9	10	0	Erosion of natural deposits; Runoff from orchards; Runoff from glass and electronics production wastes
Copper ¹ (2019)	ppm	0.076	BDL - 0.356	1.3	0	Erosion of natural deposits; Leaching from wood preservatives; Corrosion of household plumbing systems
Lead ¹ (2019)	ppb	1.0	BDL – 10.2	15	1.3	Corrosion of household plumbing systems; Erosion of natural deposits
Fluoride (2020)	ppm	0.911	0.911	4	4	Erosion of natural deposits; Water additive which promotes stronger teeth
Barium (2020)	ppm	0.347	0.347	2	2	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Sodium (2020)	ppm	75.6	75.6	NA	NA	Erosion of natural deposits
DISINFECTANTS						
Chlorine	ppm	2.33	1.40 (Average)	4	4	By-product of disinfection
VOLATILE ORGANIC CHEMICALS						
Total Trihalomethanes (TTHM)	ppb	20.0	5.4 – 20.0	80	NA	By-product of disinfection
Haloacetic Acids (HAA5)	ppb	8.0	6.5 – 8.0	60	NA	By-product of disinfection
MICROBIOLOGICAL						
Total coliform bacteria	NA	One Sample Tested Positive in the Months of January and May 2021	1 positive sample per month	0	0	Naturally Occurring

ppm = parts per million

ppb = parts per billion

BDL = Below Detection Limit

NA = Not Applicable

* Or MRDL for Chlorine

** Or MRDLG for Chlorine

¹Lead and Copper are reported at the 90th percentile

DEFINITIONS

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLG does not reflect the benefits of the use of disinfectants to control microbial contaminants.

Action Level (AL): The concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system shall follow.

Total Trihalomethanes (TTHM): TTHM's are the sum of the concentrations of bromodichloromethane, dibromochloromethane, tribromomethane (bromoform), and trichloromethane (chloroform).

Haloacetic Acids (HAA5): HAA5's are the sum of the concentrations of monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, bromoacetic acid, and dibromoacetic acid.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons, such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. U.S. Environmental Protection Agency and Centers for Disease Control guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at (800) 426-4791.
